When a patient is in atrial fibrillation, the patient may be asymptomatic, but at other times, the patient may complain of a rapid heartbeat, or a feeling of uneasiness. The clues in this case that the patient is in atrial fibrillation are that the ECG shows the characteristic irregularly irregular rhythm, with an absence of any distinct P waves. Clinically, the other clues are that the patient is complaining of palpitations while simultaneously experiencing sudden onset of severe, diffuse ...

An electrocardiogram (ECG or EKG) measures the heart's electrical activity. The electrocardiogram (ECG or EKG) is a noninvasive test that is used to reflect underlying heart conditions by measuring the electrical activity of the heart. By positioning leads (electrical sensing devices) on the body in standardized locations, health care professionals can learn information about many heart conditions by looking for characteristic patterns on the EKG.
