In 3D computer graphics, a voxel represents a value on a regular grid in three-dimensional space.As with pixels in a 2D bitmap, voxels themselves do not typically have their position (i.e. coordinates) explicitly encoded with their values.Instead, rendering systems infer the position of a voxel based upon its position relative to other voxels (i.e., its position in the data structure that ...

In graphic design, a grid is a structure made up of a series of intersecting straight or curved lines used to structure content. The grid serves as an armature or framework on which a designer can organize graphic elements in a rational, easy-to-absorb manner. A grid can be used to organize graphic elements in relation to a page, in relation to other graphic elements on the page, or relation to other parts of the same graphic

Because of the reliance on a uniform series of square pixels, the raster data model is referred to as a grid-based system. Typically, a single data value will be assigned to each grid locale. Each cell in a raster carries a single value, which represents the characteristic of the spatial phenomenon at a location denoted by its row and column.

A model hyperparameter is a characteristic of a model that is external to the model and whose value cannot be estimated from data. The value of the hyperparameter has to be set before the learning process begins. For example, c in Support Vector Machines, k in k-Nearest Neighbors, the number of hidden layers in Neural Networks. In contrast, a parameter is an internal characteristic of the ...
