Logistic Reporting ...

Stereotype logistic regression allows you to specify multiple equations to capture the effects of those latent variables, which you then parameterize in terms of observable characteristics. Unlike with multinomial logit, the number of equations you specify could be less than $m - 1$, where m is the number of categories of the dependent variable.

Title stata.com scobit — Skewed logistic regression

Logistic regression, also called a logit model, is used to model dichotomous outcome variables. In the logit model the log odds of the outcome is modeled as a linear combination of the predictor variables. Please note: The purpose of this page is to show how to use various data analysis

Stata Logit

Stata requires that the dependent variable for a logistic regression is a dichotomous variable that is coded 1 if someone has the outcome of interest, and 0 otherwise. If yours is not, you need to recode it before beginning (or you will get an error message). (See the “Recoding Variables...” handout for more information).
